

# DATABASE TOOLS FOR AWS

---

Manage the cloud components of Amazon Web Services with IDERA products

---

## INTRODUCTION

The cloud delivers information technology as a service on demand, allowing users to only consume the capacity they need. The cloud is the infrastructure that the services run on. As such, users benefit from the flexibility, economies of scale, and optimized management of resources. However, these offerings still require data professionals to set up and make tweaks to suit their organization's current and changing business needs.

No matter the cloud configuration, IDERA provides solutions to help monitor, manage, secure, model, and develop databases in cloud environments based on your specific needs. IDERA offers multiple products in its portfolio to ease the burden of accessing and managing cloud database environments and simplifying migrations of data to the cloud. In this solution brief, learn how to manage the different cloud components of Amazon Web Services (AWS) with products from IDERA.

“

**IDERA** provides improved response times and troubleshooting information on our hosted systems for SQL Server in the cloud.

Small Business, Computer Software, USA, 15 to 49 SQL Server Databases

”

Most of IDERA's products run on Amazon Elastic Compute Cloud (EC2) virtual machines, support database instances on Amazon EC2 virtual machines and can map drives to Amazon Simple Storage Service (S3). SQL Safe Backup supports Amazon S3, and several of IDERA's products support Amazon Relational Database Service (RDS) managed databases.

# SUPPORT AMAZON RELATIONAL DATABASE SERVICE (RDS) MANAGED DATABASES

- **Database Monitoring and Performance:** SQL Doctor supports Amazon RDS for Microsoft SQL Server. SQL Diagnostic Manager for MySQL monitors Amazon RDS for MySQL and Amazon RDS for MariaDB.

# SUPPORT AMAZON SIMPLE STORAGE SERVICE (S3)

For Microsoft Windows, cloud storage can map as a network drive or a removable drive via third-party software (for example, CloudBerry Drive and Mountain Duck) for Amazon S3. Network drives are available to other computers in the local network. Removable drives are available only to users of the local system. Microsoft Windows sends fewer requests to network drives, and Microsoft Windows is more tolerant of delays for network drives.
